“JnanaSangama”, Belgaum -590014, Karnataka.

LAB RECORD

Computer Network Lab (23CS5PCCON)

Submitted by

HARSHAVARDHAN BR(1BM22CS110)

in partial fulfillment for the award of the degree of

**BACHELOROFENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING
(Autonomous Institution under VTU)**

BENGALURU-560019 Academic Year 2024-25 (odd)

B.M.S. College of Engineering

Bull Temple Road, Bangalore 560019

(Affiliated To Visvesvaraya Technological University, Belgaum)

Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled “ Computer Network (23CS5PCCON)” carried out by **Harshavardhan BR (1BM22CS110)**, who is a bonafide student of **B.M.S. College of Engineering**. It is in partial fulfilment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements of the above-mentioned subject and the work prescribed for the said degree.

Spoorthi DM Associate Professor Department of CSE, BMSCE	Dr. Kavitha Sooda Professor & HOD Department of CSE, BMSCE

Program 1

Aim: Create a topology and simulate sending a simple PDU from source to destination using hub and switch as connecting devices and demonstrate ping messages.

Topology , Procedure and Observation:

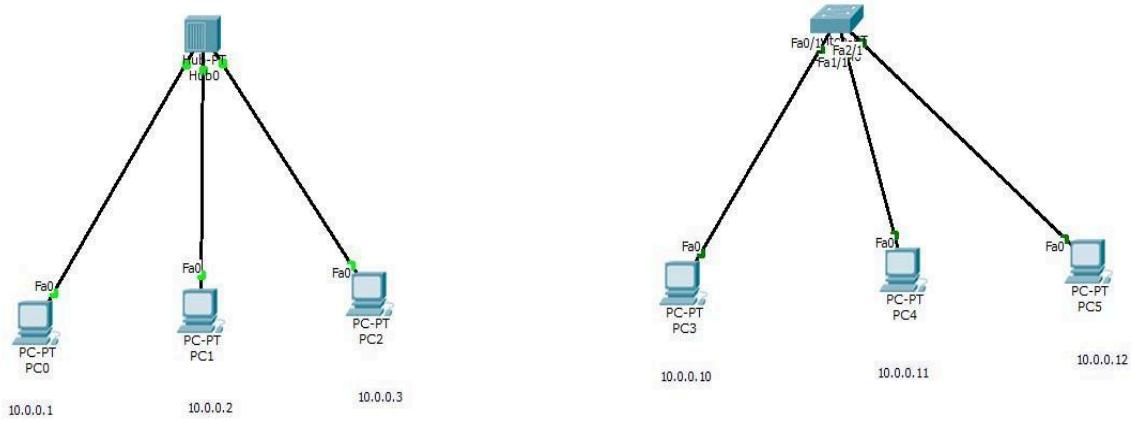

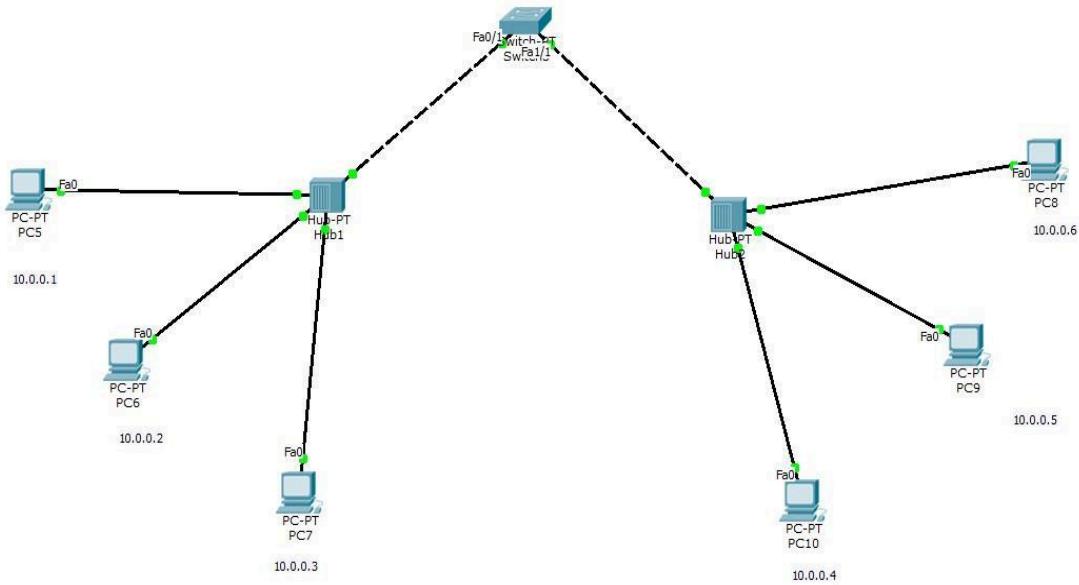

Aim:- To create Sample network consisting of 3 PC connected to a central hub and another network with 3 PC's connected to switch. This connection will help observe the behavior of data transmission using hub & switch.

Topology:- 3 PC's are connected to a hub & switch using straight through ethernet cables.

Observation:- Hub broadcasts packets to all devices which may cause through unnecessary traffic.

Switch forwards packets only to appropriate device by learning MAC address, using it more efficient for reducing traffic.

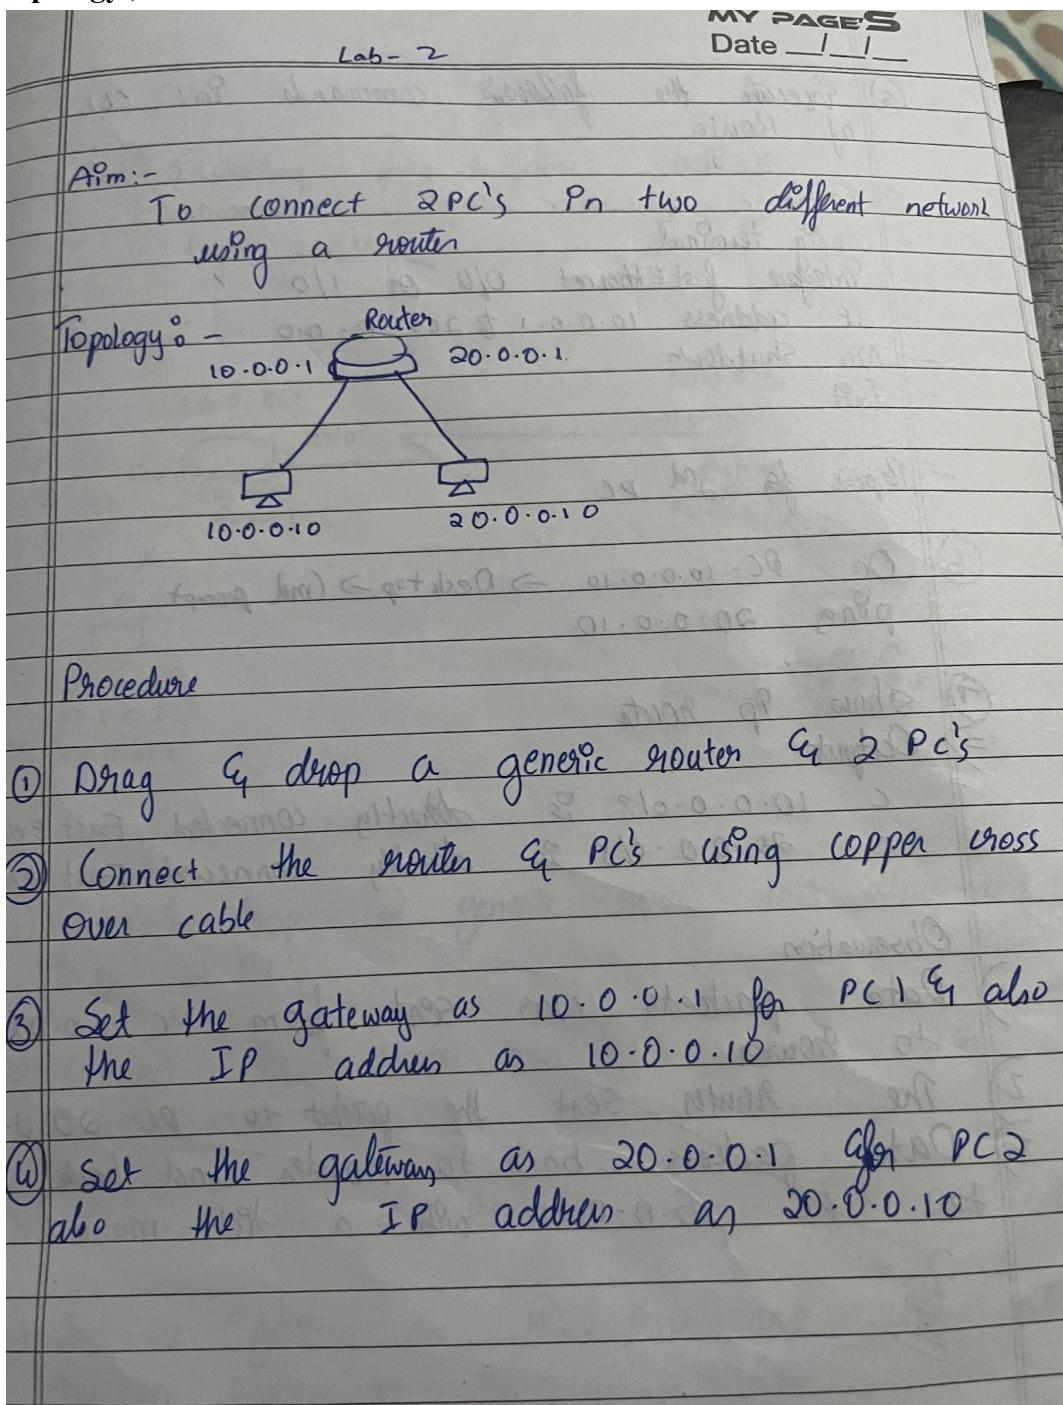

Screen Shots:

Program 2

Aim: Configure IP address to routers in packet tracer. Explore the following messages: ping responses, destination unreachable, request timed out, reply.

Topology , Procedure and Observation:

⑤ Execute the following commands in CLI of Router

- Enable
- config terminal
- Inteface fast Ethernet 0/0 or 1/0
- IP address 10.0.0.1 to 255.0.0.0
- No Shutdown
- Exit
- Repeat for 2nd PC

⑥ On PC - 10.0.0.10 → Desktop → (md prompt)
ping 20.0.0.10

⑦ show ip route

⇒ Output

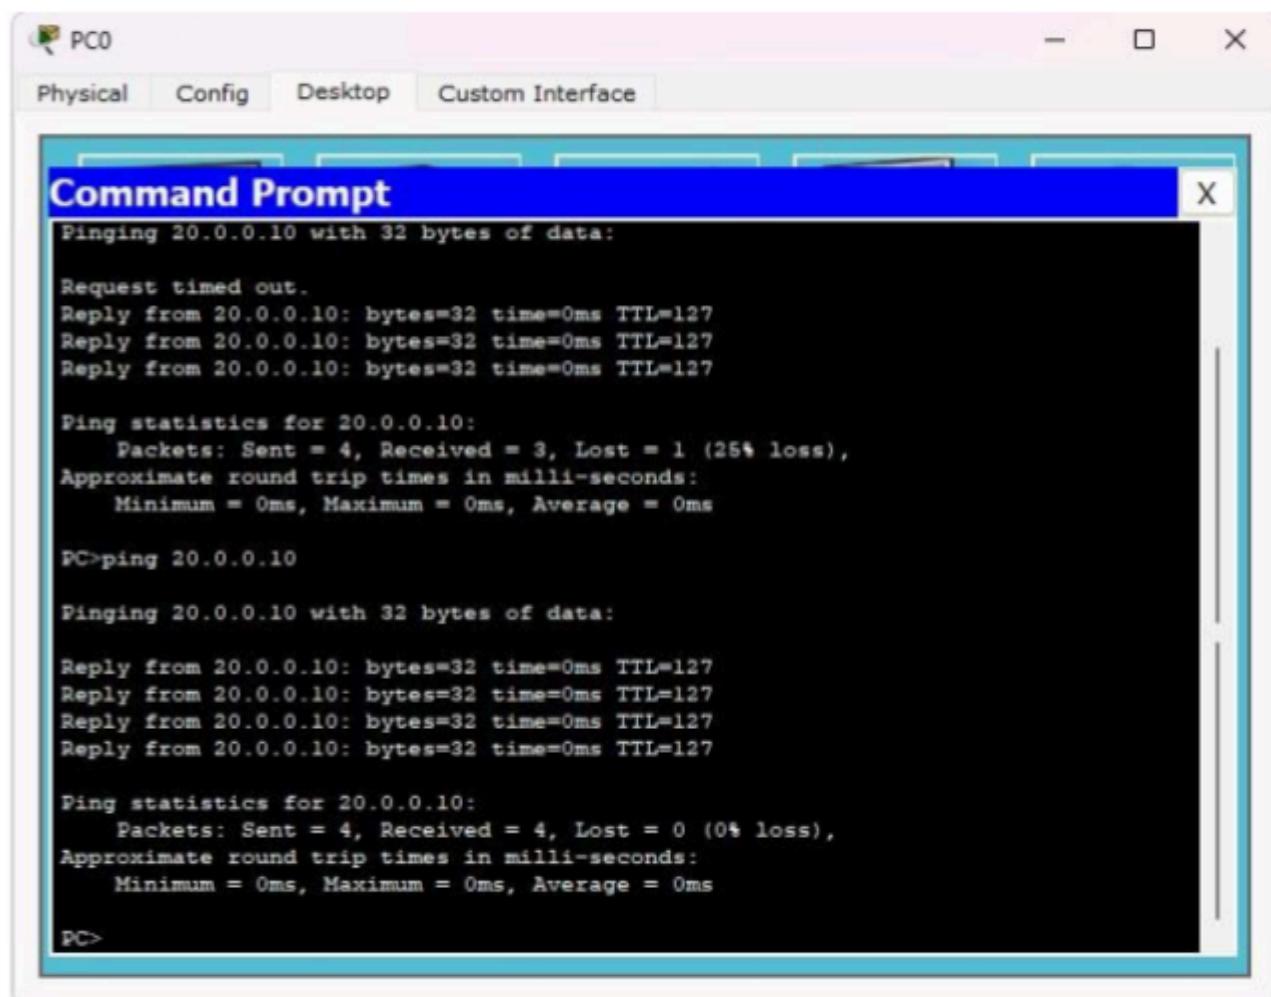

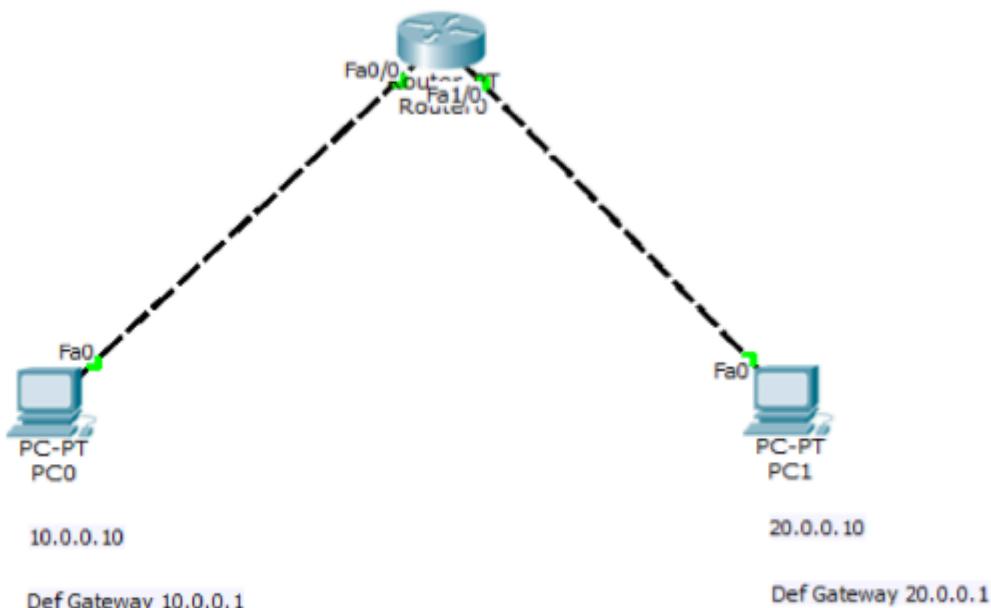

c 10.0.0.0/8 is directly connected Fast Ethernet 0/0

c 20.0.0.0/8 is directly connected Fast Ethernet 1/0

Observation

- 1) Data packets was sent from PC 10.0.0.10 to Router
- 2) The Router sent the packet to PC 20.0.0.10
- 3) Data packets back to Router and back to PC 10.0.0.10 with a tick mark

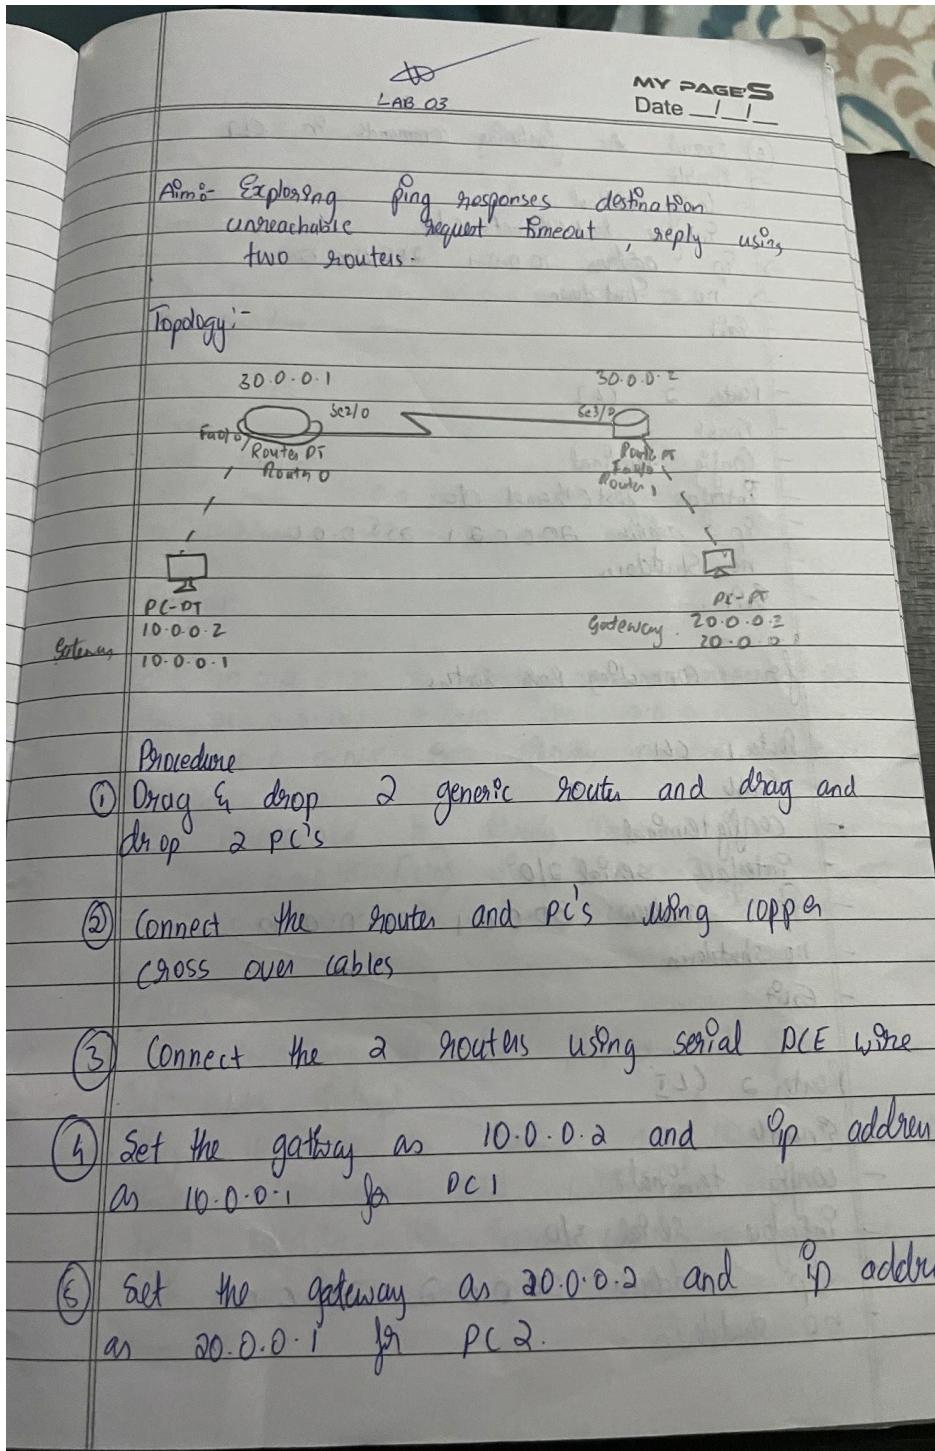

Screen Shots:

Program 3

Aim: Configure default route, static route to the Router(Part 1).

Topology , Procedure and Observation:

⑥ Execute the following commands in CLI

- > Enable
- > Config terminal
- > Interface fastEthernet 0/0
- > Ip address 10.0.0.1 255.0.0.0
- > no Shutdown
- > Exit

- Router 2 (L)
- > Enable
- > Config terminal
- > Interface fastEthernet 0/0
- > Ip address 20.0.0.2 255.0.0.0
- > no Shutdown
- > Exit

for connecting Both routers

Router 1 CLI

- > Enable
- > Config terminal
- > Interface serial 2/0
- > Ip address 30.0.0.1 255.0.0.0
- > no Shutdown
- > Exit

Router 2 CLI

- > Enable
- > Config terminal
- > Interface serial 3/0
- > Ip address 30.0.0.2 255.0.0.0
- > no Shutdown

for connecting 10.0.0.1 to 20.0.0.1,

- Router 1 CLI
- Enable
- config terminal
- ip route 20.0.0.0 255.0.0.0 30.0.0.2
- no shutdown

Router 2 CLI

- Enable
- config terminal
- ip route 10.0.0.0 255.0.0.0 30.0.0.1
- no shutdown

Output

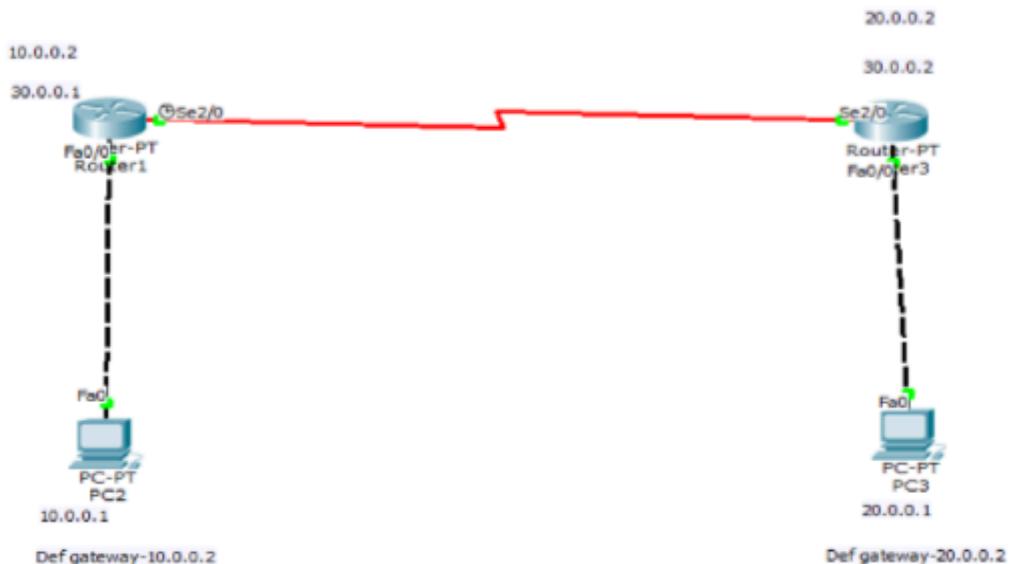

C 10.0.0.0/8 is directly connected, FastEthernet 0/0
 S 20.0.0.0/8 [1/0] via 30.0.0.2
 C 30.0.0.0/8 is directly connected, serial 2/0

C 10.0.0.0/8 is directly connected
 S 20.0.0.0/8 [1/0] via 30.0.0.2
 C 30.0.0.0/8 is directly connected, Serial 2/0

Observation

- 1) The connection were done properly and green lights were displayed.
- 2) Ping 10.0.0.1 to 30.0.0.1 and 10.0.0.1 worked whereas as 20.0.0.1 didn't work from PC.
- 3) for resolving this issue we have to use ip route with 20.0.0.1 from Rutaer 1 for connecting it Once connected it works.

Reply from 10.0.0.2: Destination host unreachable.  
  
Ping statistics for 20.0.0.2:  
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),  
  
PC>
```

Program 4

Aim: Configure default route, static route to the Router(Part 2).

Topology , Procedure and Observation:

③ In Router 3 CLI

Enable

Config terminal

Interface fastEthernet 0/0

Ip address 40.0.0.1 255.0.0.0

No shutdown

exit

Interface Serial 2/0

Ip address 30.0.0.21 255.0.0.0

No shutdown

exit

④ In Router 2 CLI

Enable

Config terminal 2

Interface Serial 2/0

Ip address 20.0.0.2 255.0.0.0

No shutdown

exit

Interface Serial 3/0

Ip address 30.0.0.2 255.0.0.0

exit

⑤ Static configuration for

- Router 1

Ip route 0.0.0.0 0.0.0.0 20.0.0.1

- Router 2

Ip route 0.0.0.0 0.0.0.0 30.0.0.1

for Router 2:

ip	route	10.0.0.0	255.0.0.0	20.0.0.1
ip	route	40.0.0.0	255.0.0.0	30.0.0.1

→

Observation

Router 1

- C 10.0.0.0/8 is directly connected FastEthernet 0/0
- C 20.0.0.0/8 is directly connected, Serial 2/0
- S X 0.0.0.0/0 [1/0] via 20.0.0.2

Router 2

- S 10.0.0.0/8 [1/0] via 20.0.0.2
- C 20.0.0.0/8 is directly connected Serial 3/0
- C 30.0.0.0/8 is directly connected Serial 3/0
- S 40.0.0.0/8 [1/0] via 30.0.0.2

Router 3

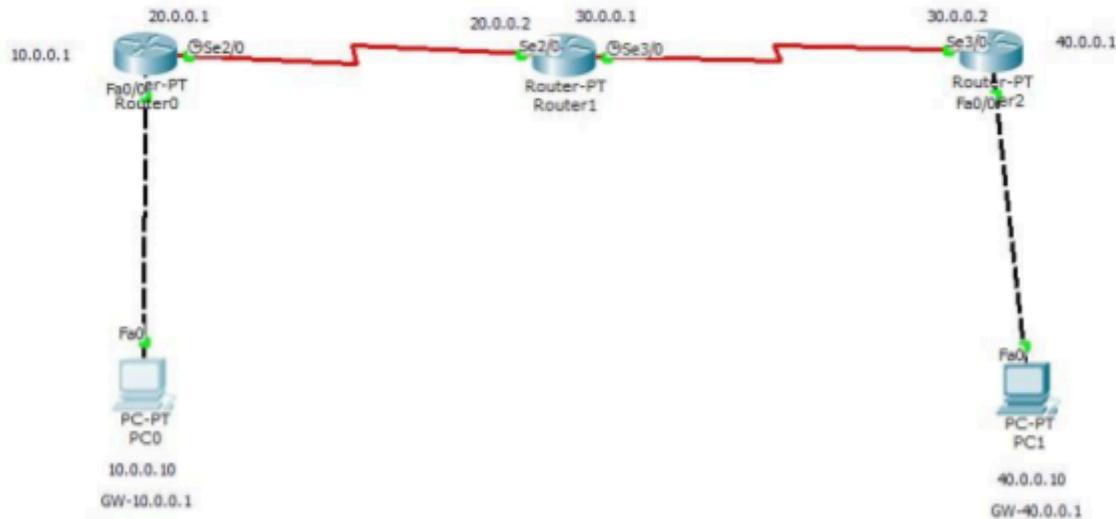

- C 30.0.0.0/8 is directly connected Serial 2/0
- C 40.0.0.0/8 is directly connected fastethernet0/0
- S X 0.0.0.0/0 [1/0] via 30.0.0.1

On PC2 CLI

ping 10.0.0.1

(1)
2/0/0/0

Reply from 10.0.0.1 bytes 32 time=6ms TTL=253
Successful

PC0

Physical Config Desktop Custom Interface

Command Prompt

```

Pinging 40.0.0.10 with 32 bytes of data:

Request timed out.
Reply from 40.0.0.10: bytes=32 time=7ms TTL=125
Reply from 40.0.0.10: bytes=32 time=6ms TTL=125
Reply from 40.0.0.10: bytes=32 time=5ms TTL=125

Ping statistics for 40.0.0.10:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
Approximate round trip times in milli-seconds:
    Minimum = 5ms, Maximum = 7ms, Average = 6ms

PC>ping 40.0.0.10

Pinging 40.0.0.10 with 32 bytes of data:

Reply from 40.0.0.10: bytes=32 time=8ms TTL=125
Reply from 40.0.0.10: bytes=32 time=7ms TTL=125
Reply from 40.0.0.10: bytes=32 time=9ms TTL=125
Reply from 40.0.0.10: bytes=32 time=6ms TTL=125

Ping statistics for 40.0.0.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 6ms, Maximum = 9ms, Average = 7ms

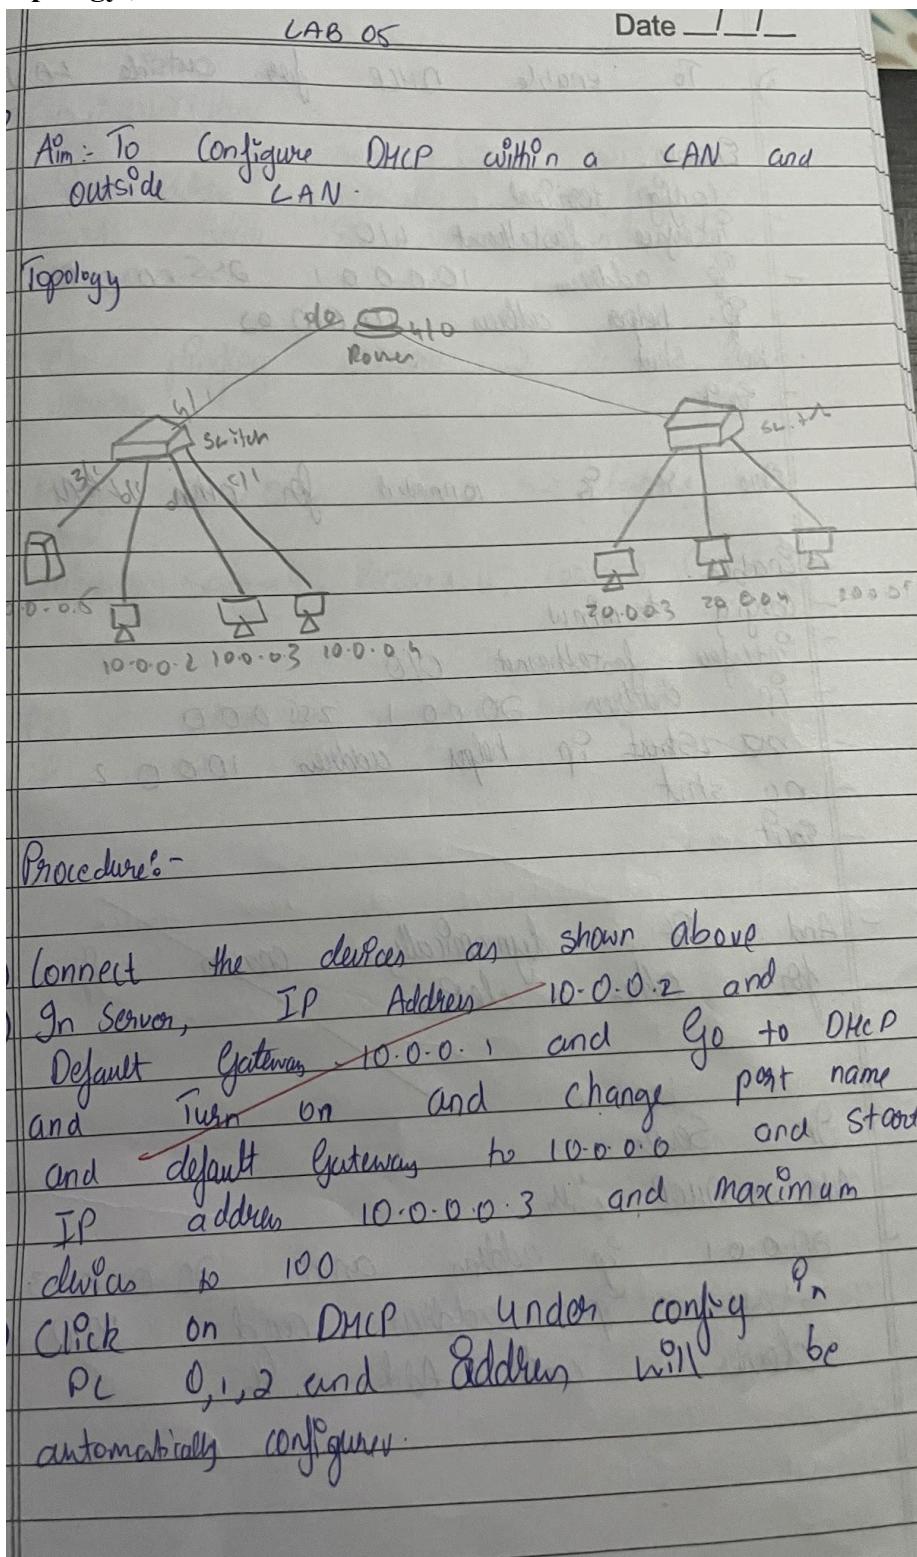

PC>

```

Program 5

Aim: Configure DHCP within a LAN and outside LAN.

Topology , Procedure and Observation:

5) To enable DHCP for outside LAN

- Enable
- config terminal
- interface fastethernet 0/0
- ip address 10.0.0.1 255.0.0.0
- ip helper address 10.0.0.2
- no shut
- exit

Once it is connected for other LAN

- Enable
- config terminal
- interface fastethernet 0/0
- ip address 20.0.0.1 255.0.0.0
- no restart ip helper address 10.0.0.2
- no shut
- exit
- And if dynamically enables ip address for other clients

- In Services

- Add DHCP with
- start IP address and 20.0.0.3
- end IP address and 10.0
- and Add 16,

Date 11

OBSERVATION

Q address dynamically set for both LAN with QP address 10.0.0.1 and 20.0.0.1

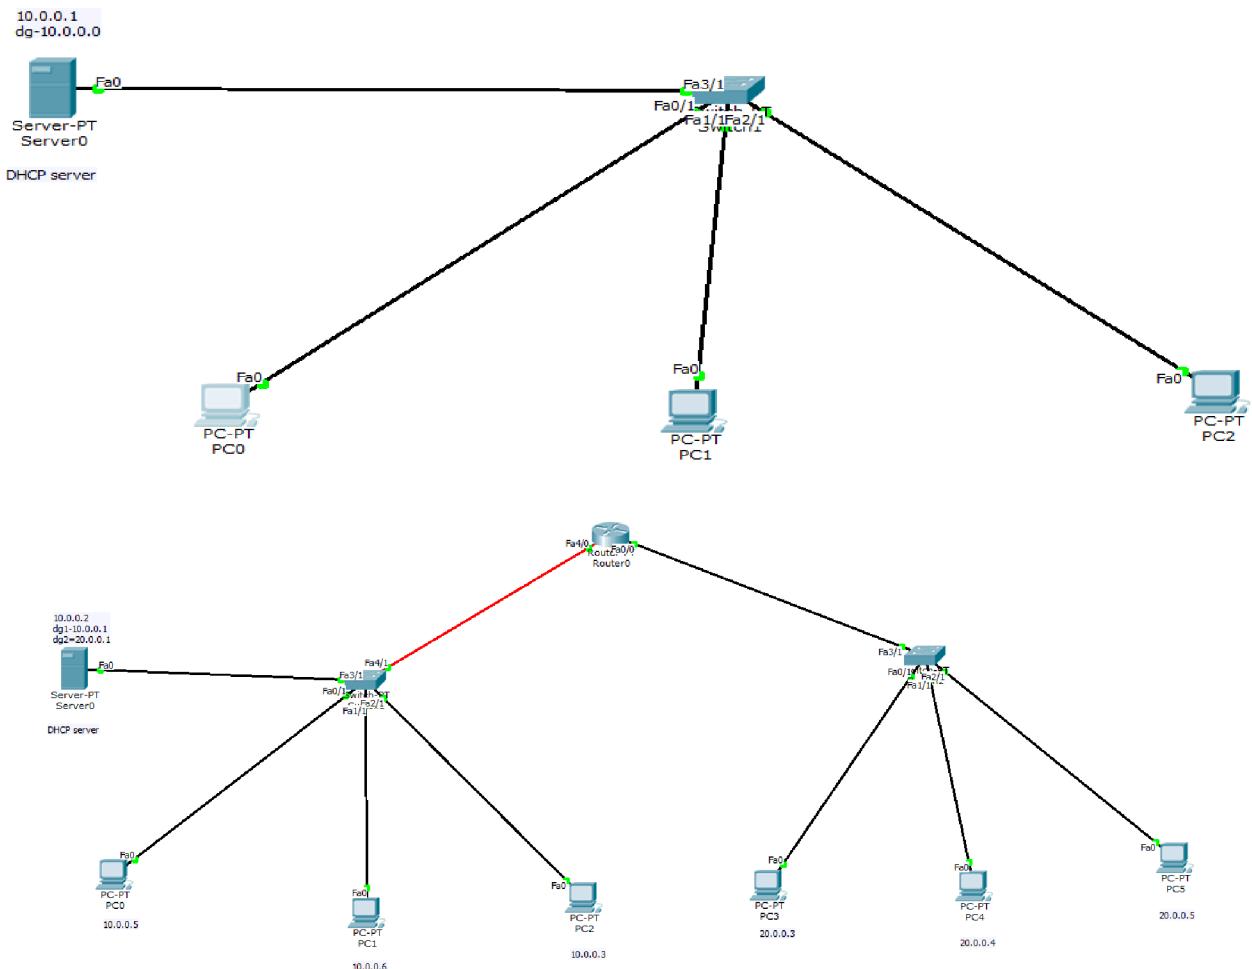

On pinging network 2 duran from network

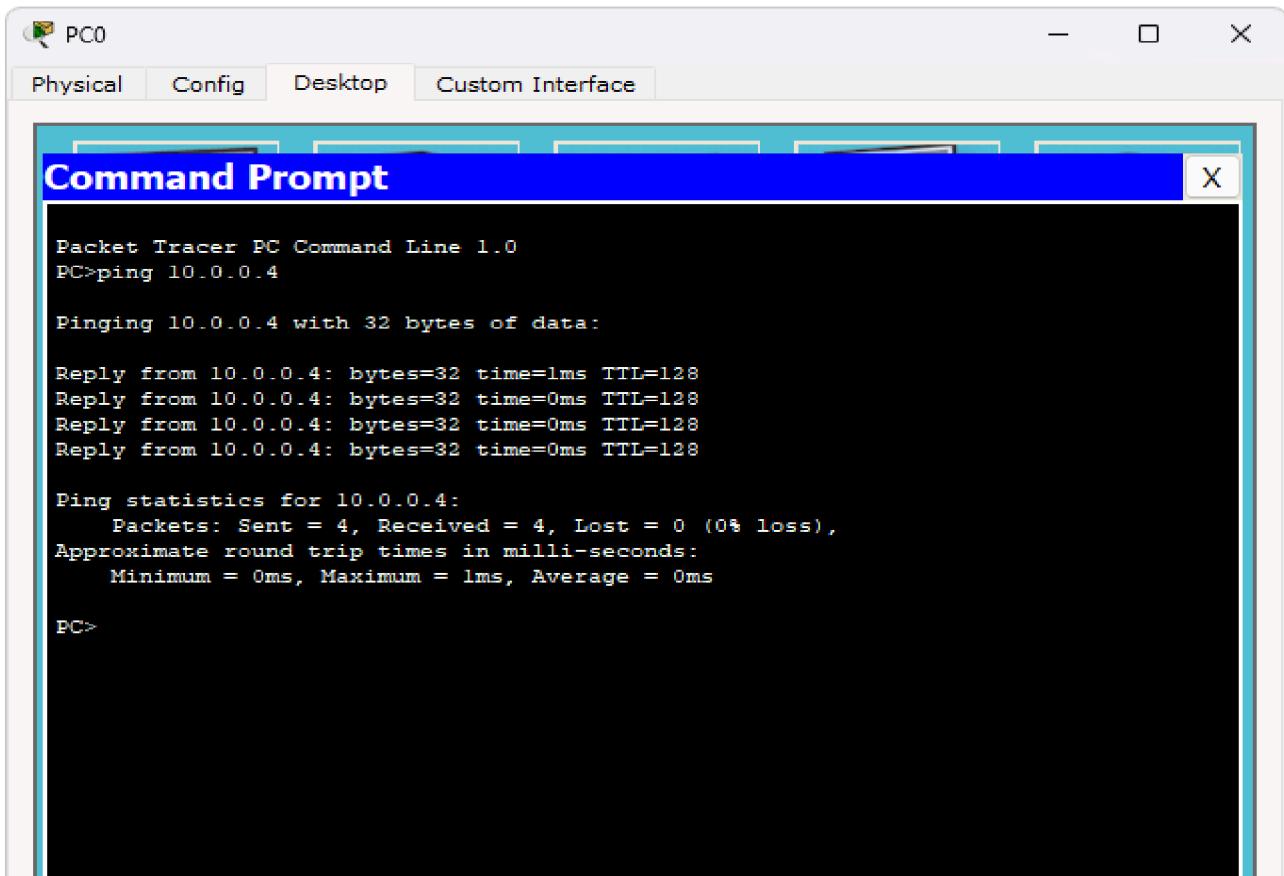

Pong 20.0.0.3 with 32 bytes data

packets Sent=4, Received=4, Lost=0 (0% loss)

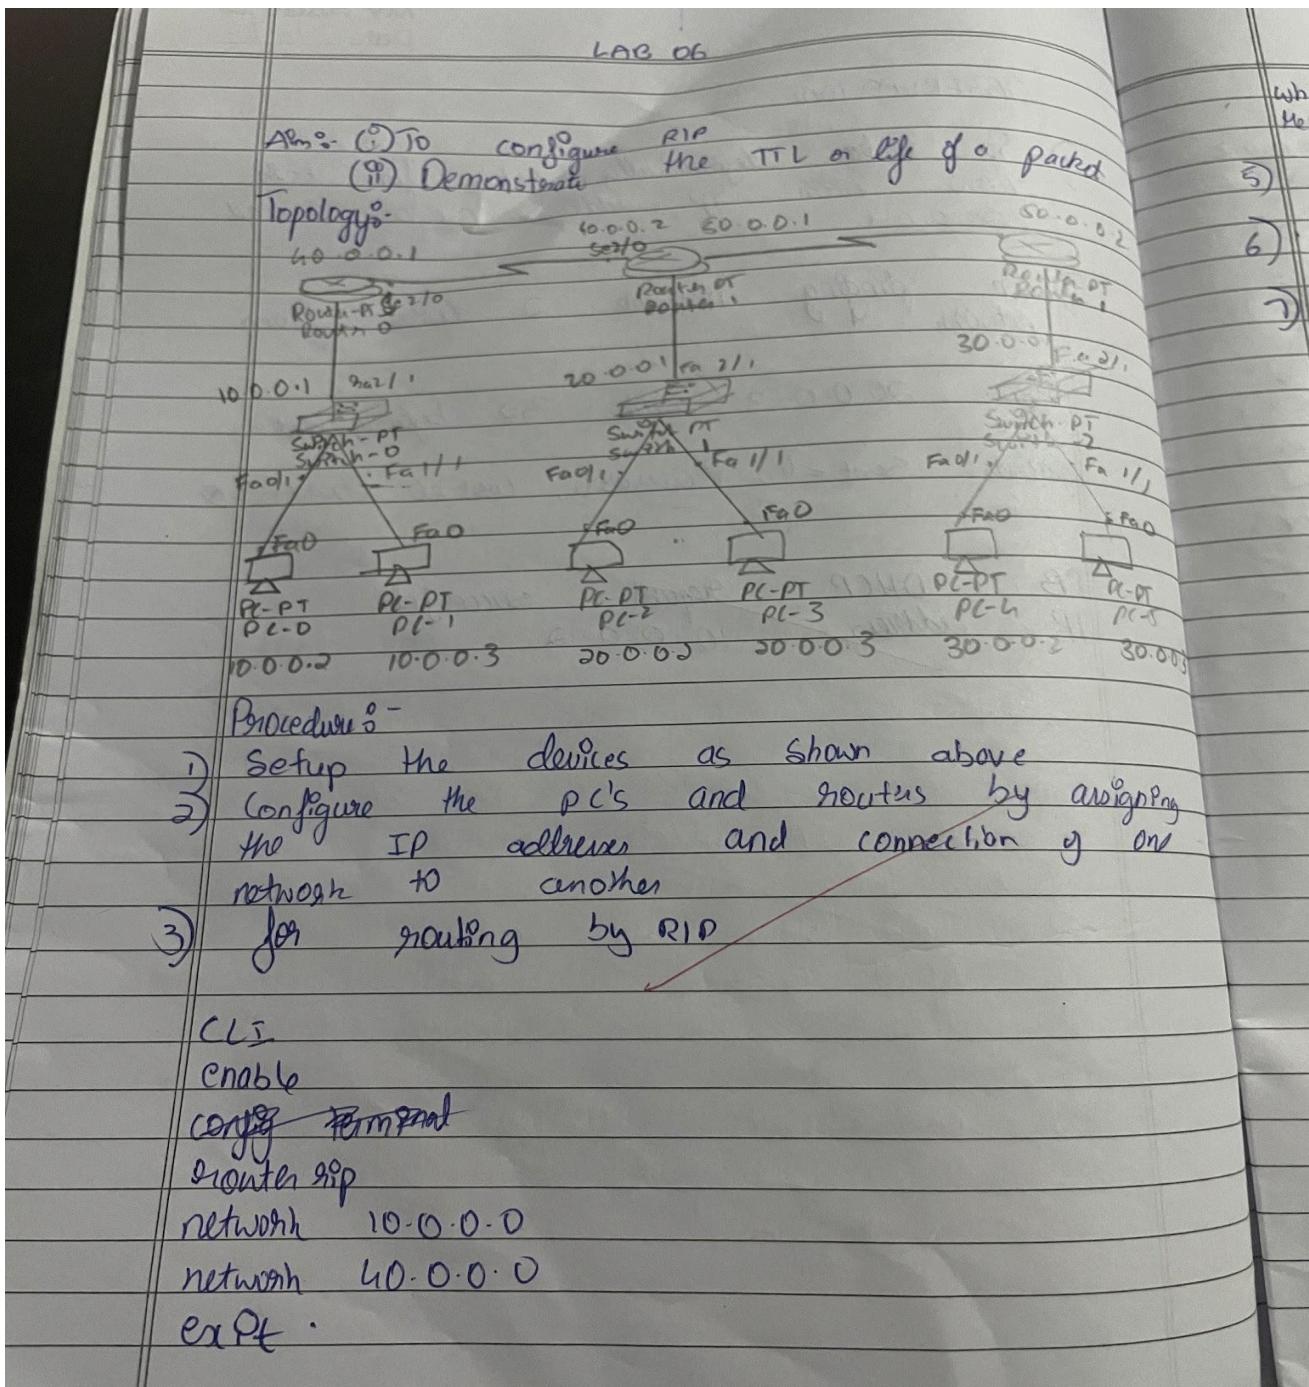

PB DHCP request successful
IP address 10.0.0.2

Screen Shots:

Program 6 Aim: Configure RIP routing Protocol in Routers .Topology , Procedure and Observation:

when show Ip route Ps gives a
Me next command

- 5) Repeat the same commands for other routers.
- 6) This completes the routing in the topology.
- 7) Ping a message from a PC to PLC

Output

Show Ip route

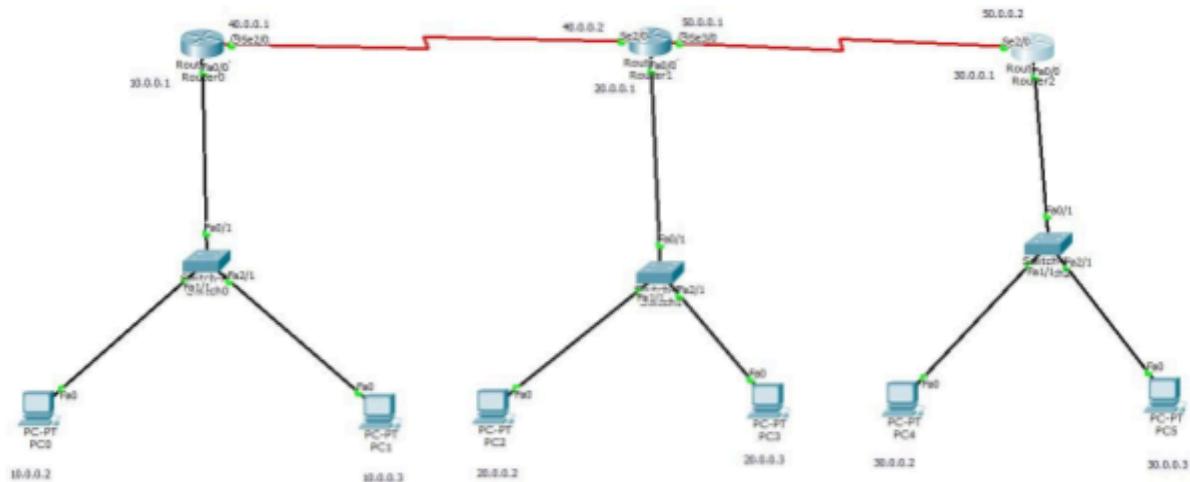

C	10.0.0.0/8	is directly connected Fast Ethernet 0/0
R	20.0.0.0/8	[120/1] via 40.0.0.2 00.00.11
R	30.0.0.0/8	[120/1] via 40.0.0.2 100.00.11
C	40.0.0.0/8	is directly connected Serial 2/0
R	50.0.0.0/8	via 40.0.0.2, 00.00.11, serial 2/0

1) Ping 30.0.0.2

Pinging 30.0.0.2 with 32 bytes of dat.

packets sent=6, received=6, lost=0 (0% loss)

Screen Shots:

```
PC0
Physical Config Desktop Custom Interface

Command Prompt
Pinging 30.0.0.2 with 32 bytes of data:
Request timed out.
Reply from 30.0.0.2: bytes=32 time=7ms TTL=125
Reply from 30.0.0.2: bytes=32 time=6ms TTL=125

    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 4ms, Maximum = 7ms, Average = 6ms

PC>
```

Program 7

Aim: Demonstrate the TTL/ Life of a Packet .

Topology , Procedure and Observation:

Output 8 -

1) We can observe that the TTL starts at 255 and gradually as the packet is being transferred, the TTL reduces finally to 125.

2) At the End, TTL reduces to 125.

3) In the Simulation panel, under event life we can see where the packet was.

$$TTL = 255 \text{ ms}$$

Outbound

$$TTL = 254 \text{ ms}$$

R1

Inbound

$$TTL = 254 \text{ ms}$$

Outbound

$$TTL = 253 \text{ ms}$$

R2

Inbound

$$TTL = 253 \text{ ms}$$

Outbound

$$TTL = 252 \text{ ms}$$

Program 9

Aim: Configure Web Server, DNS within a LAN.

Topology , Procedure and Observation:

Exp - 12

AIM:- To configure DNS server to domain stock
the mapping of IP addresses to domain name.

Topology :-

The diagram illustrates a simple network topology. A central hub (represented by a circle with three lines) is connected to three devices: a PC (labeled 'PC0' with IP '10.0.0.1'), a Server (labeled 'Server0' with IP '10.0.0.2'), and a Switch (labeled 'Switch0'). The connection between the hub and each device is labeled 'Fa0/1'. The PC and Server are also shown with their respective IP addresses below them.

Configuration :-

PC0:
IP address 10.0.0.2

Server0
IP address : 10.0.0.3
connect PC0 to Server0 via switch0/1
PC0 connects to Switch on interface Fa0/0
Switch on Fa0/1
Server connects to Switch on interface Fa0/1
Switch on Fa0/1

Server 0

Go to Server → Service → DNS

Enable pn

In file test fields add.

name: abc

address: 10.0.0.3

Click add

go to HTTP

click edit for index.html {change of ready}

click save

Procedure:

- 1) Go to PC0 → Desktop → Web browser
- 2) Search 'abc' in url bar

Output:-

Welcome to

Cisco Park Train.

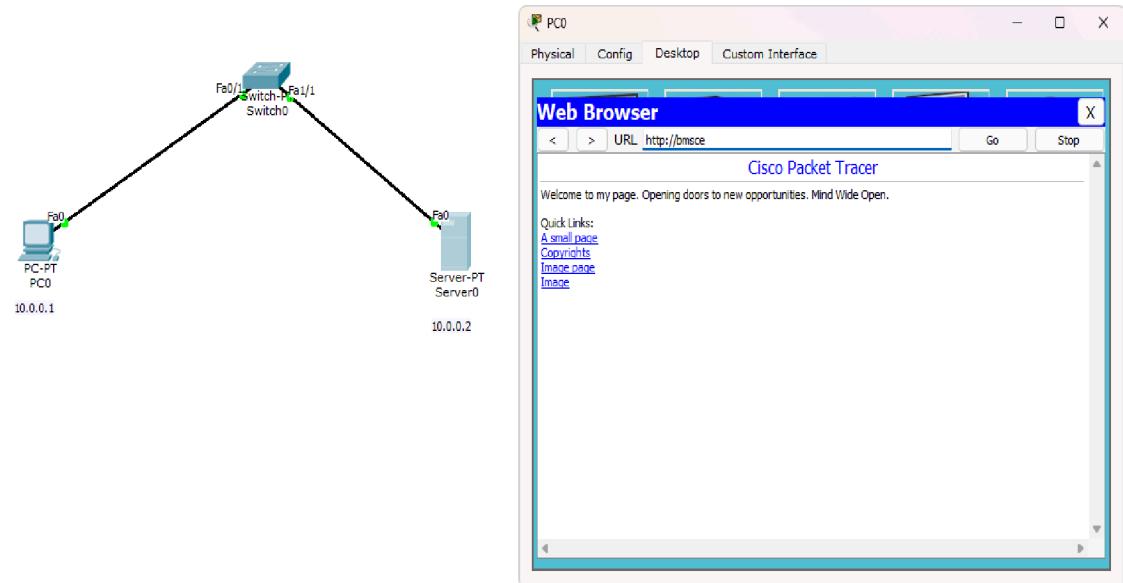

Copyrights

Image.

Observation

DNS translates domain name to IP address
simplifies accessing website by using
human readable names.

Screen Shots:

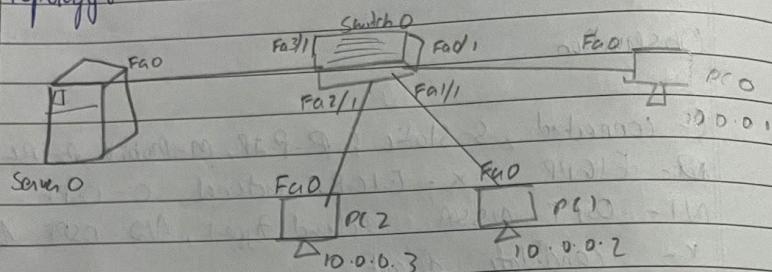

Program 10

Aim: To construct simple LAN and understand the concept and operation of Address Resolution Protocol (ARP)

Topology , Procedure and Observation:

Ex-8
Aim: To construct a Simple LAN to understand operation of address Resolution Protocol (ARP)

Topology :-

1) Switch connected to 3 PC's and a server via three fast ethernet interfaces & one ethernet interface respectively

2) All connections made via copper straight-through cable

Procedure:-

1) Place a switch, 3 PC's connected to switch 0 and server

2) Assign an IP Address & Subnet mask to all the devices then connect them via a switch

3) Use the Pcap tool , click on a PC to view ARP Table /

- 4) Display ARP Table
- 5) In CLI of switch
 - Show mac address
- 6) Use capture button in the simulation panel to go step by step so that there are changes in ARP
- 7) Observe switch as well as node update in the ARP Table

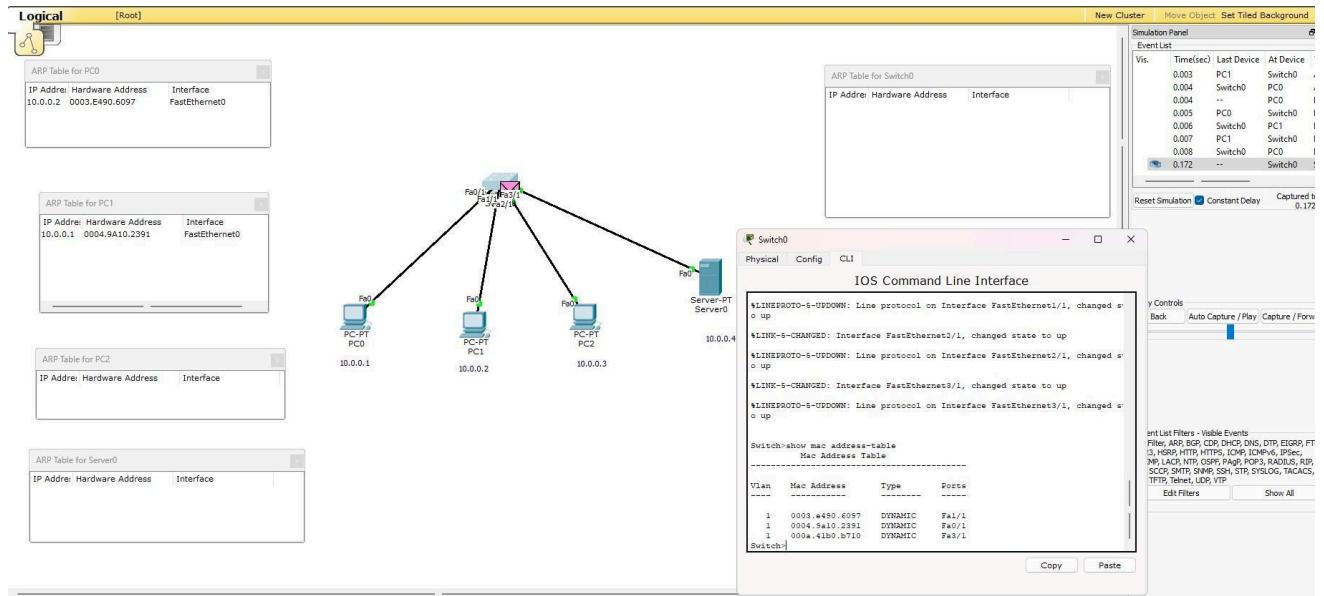

Observation

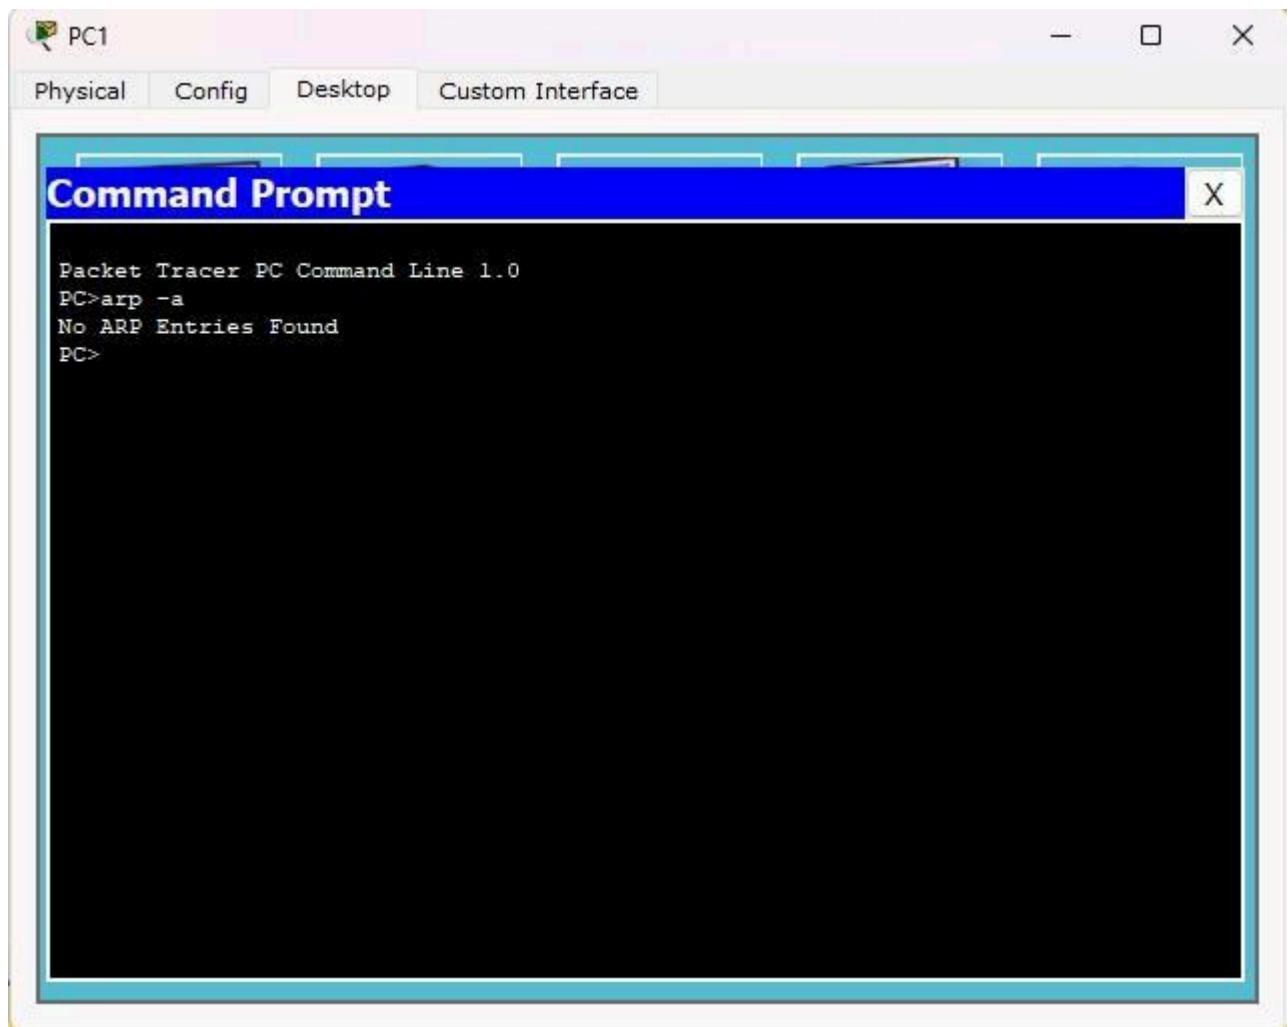

- As the message travels from one source host to its destination host the ARP table of all devices gets updated
- ARP maps an IP address to a MAC address to ensure communications within a local network

ARP Table for PC 0

IP	Mac Address	Interface
10.0.0.3	00:00:29:AC:B8	Fast Ethernet 0

Screen Shots:

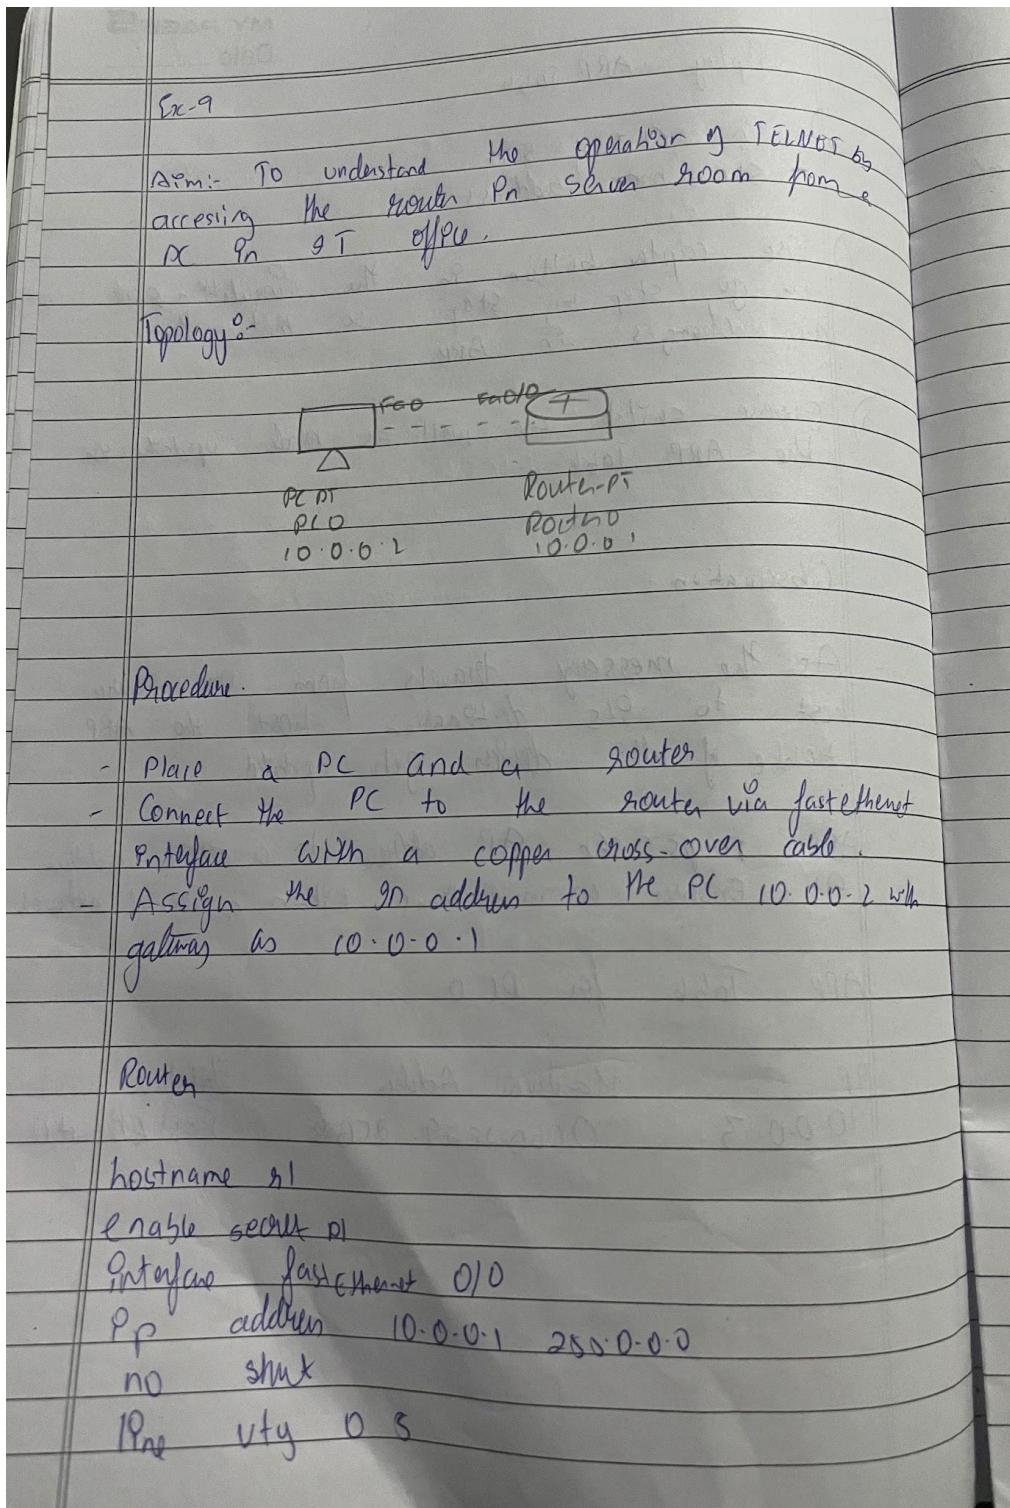

Program 11

Aim: To understand the operation of TELNET by accessing the router in the server room from a PC in the IT office.

Topology , Procedure and Observation:

login
password PD
exit

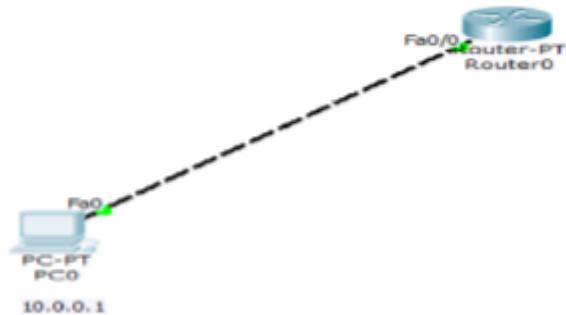

In Command prompt

Password for user authentication is P0
Password for enable is P)

Observations

- TCCNET is a protocol for remote access
- It allows command-line communication on a network
- The PC is able to send the data to gateway and indicates that the gateway is available and connected

Program 12

Aim: To construct a VLAN and make the PC's communicate among a VLAN.

Topology , Procedure and Observation:

Date ___/___/___

enable.

terminal

Interface Fa 0/0

Ip address 192.168.1.1 255.255.255.0

no shut

3) In the switch go to config task & select
VLAN Database

4) Set the VLAN number & VLAN name

Select the Port type & make it to trunk

VLAN trunking allows switching to forward
frame from different VLAN on a single
link called trunk

5) This is done by adding an additional
header information called tag to the
ethernet frame

6) Look onto the Interface of the switch
with a NEW VLAN System

Router

Interface fastethernet 0/0.1

encapsulation dot1q 2

Ip address 192.168.2.1 255.255.255.0

no shut

exit

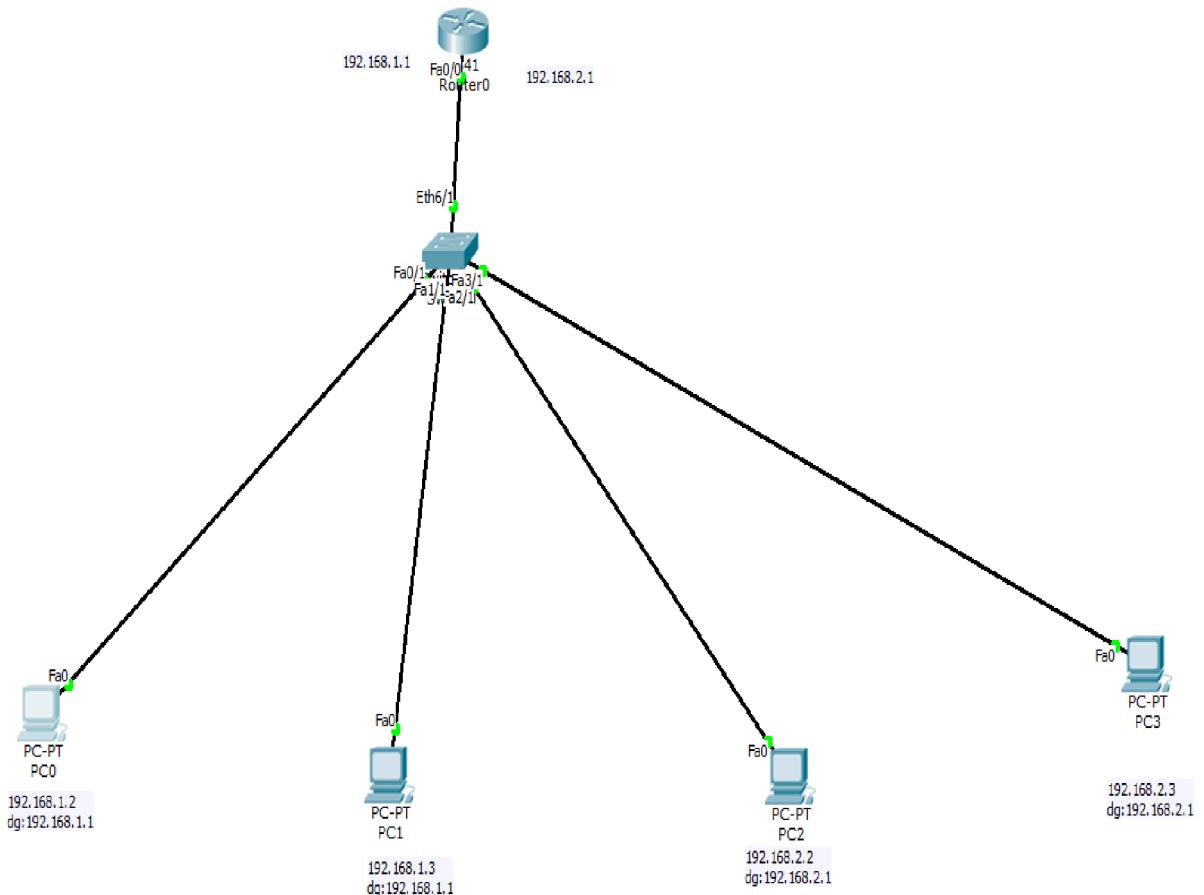

exit

Observation

A VCAN groups of enhances segments a network into virtual security by reduces broadcast traffic.

On pinging the VCAN, the PCs are able to communicate

Program 13

Aim: To construct a WLAN and make the nodes communicate wirelessly.

Topology , Procedure and Observation:

Date 11

Exp 11

Aim :- To construct WLAN and make nodes communicate wirelessly

Topology :-

The diagram illustrates a network topology. At the top left is a Router with two ports labeled 'Fast0' and 'Fast1'. A line connects the 'Fast0' port to a PC labeled 'PC0' with IP '10.0.0.1'. Another line connects the 'Fast0' port to an Access Point (AP) labeled 'Access Point0'. A line connects the 'Fast1' port of the Router to the AP. The AP is shown with three ports: one to a Laptop labeled 'Laptop0' with IP '10.0.0.4', one to a PC labeled 'PC1' with IP '10.0.0.3', and one to the Router's 'Fast1' port.

Procedures:-

- 1) Place a Switch & connect it to a PC, router & an access point
- 2) Place a PC & laptop without any wired connection
- 3) Configure PC0 with IP address 10.0.0.1 & switch 0
- 4) Configure Access Point

Point → SSID Name → Enter any name → Select

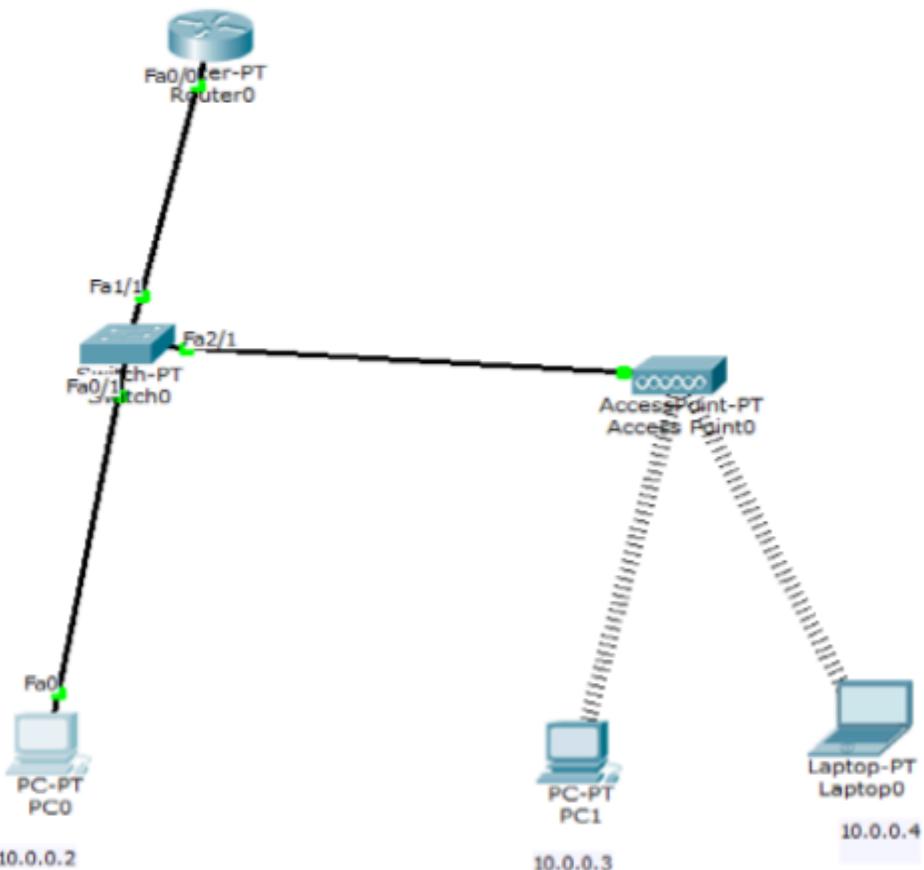

g give any 10 digit key

- 5) Configure PC & Laptop with wireless standards
- 6) Switch off the device. Drag the existing P- HOST-NM to the component listed in the LNS. Drag WMP300N wireless interface to the empty port. Switch on the device.
- 7) In config tab, a new wireless interface should have been added
- 8) Ping from one device to another wireless device

Observation

WLAN enables wireless network communication. It uses radio waves for connectivity. WLAN connects devices wirelessly within a local area. It eliminates the need for physical cables.

PART-B

Program 14

Write a program for error detecting code using CRC-CCITT (16-bits).

Code and Output:

Cycle 2

Date / /

13) Write a program for error detecting code using CRC-CCITT (16-bits)

```
def xor(a, b):
    result = []
    for i in range(0, len(b)):
        if a[i] == b[i]:
            result.append('0')
        else:
            result.append('1')
    return ''.join(result)

def mod2div(dividend, divisor):
    pich = len(divisor)
    temp = dividend[0:pich]
    while pich < len(dividend):
        if temp[0] == '1':
            temp = xor(divisor, temp) + dividend[pich]
        else:
            temp = xor('0' + divisor, temp) + dividend[pich]
        pich += 1
    if temp[0] == '1':
        temp = xor(divisor, temp)
    checkword = temp
    return checkword
```

```

def encode_Data(data, key):
    l = len(key)
    append_data = data + '0' + (l - key - 1)
    remainder = mod5e(append_data, key)
    codeword = data + remainder
    print("Remainder:", remainder)
    print("Encode Data(Data+Remainder);")

```

data = "100100"

key = "1101"

encode_Data(data, key)

Output

Remainder: 001

Encode Data(Data+Remainder) : 10010001

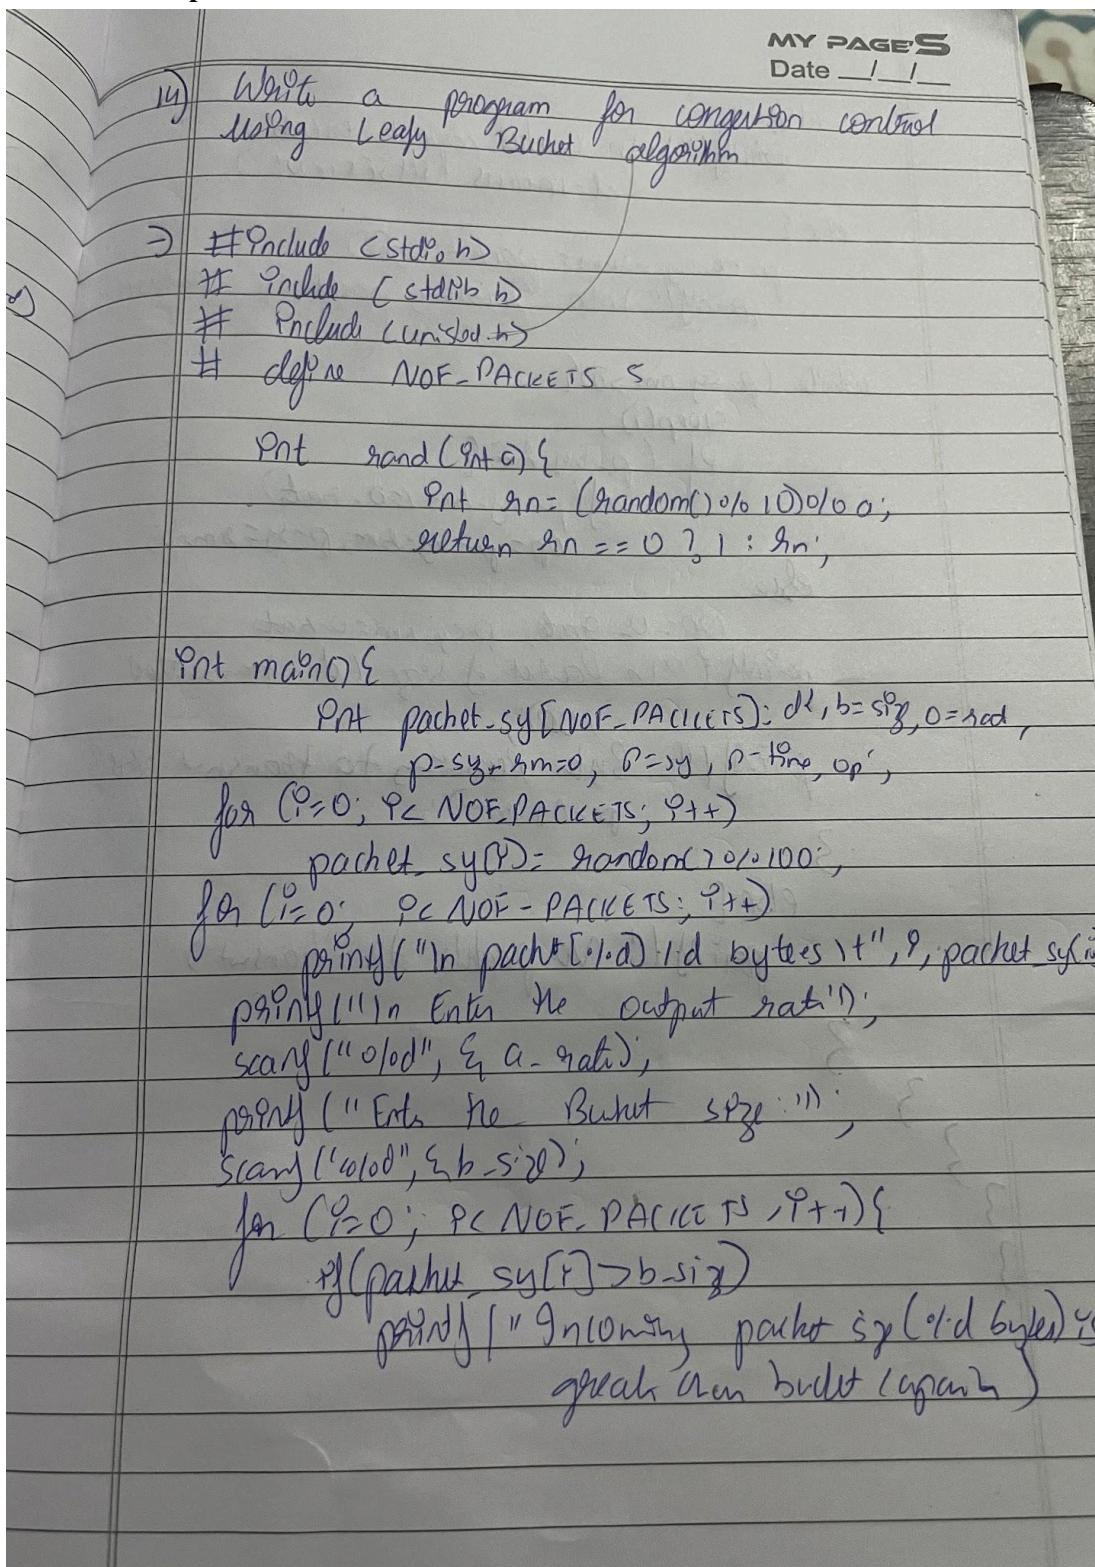

Receive side

Correct message received.

Program 15

Write a program for congestion control using Leaky bucket algorithm.

Code and Output:

else

printf("In Bucket capacity exceeds
cl-packets RESECTed"),

else {

p=sy - lmt = packet_size(),

printf("In Increasing packet size, packet %d",

while (p-sy_nm > 0) {

sleep();

yf (p-sy-hm){

yf (p-sy-hm <= 0, rate)

op = p-sy-hm, p-sy = sy_m = 0;

else

op = 0, rate, psy_nm = 0-hat

printf("In Bucket of size %d transmitted

, op);

printf(" Bytes remaining to transmit %d",
p-1y_nm);

}

else {

printf("No packets to transmit");

}

Program 17

Using UDP sockets, write a client-server program to make the client send the file name and the server to send back the contents of the requested file if present.

Code and Output:

OUTPUT

" Server output
Server is online
Hello server

Client output
Hello client

18. WIRESHARK

MY PAGE'S
Date 1/1

WIRESHARK

It is a powerful used network protocol analyzer.
It allows you to capture and export data
packets travelling a network in real time
making critical tool for studying computer
networks, troubleshooting network issues &
understanding protocols.

Key Features

- 1) Packet Capture:- Captures ~~background~~ the network traffic from various interfaces
- 2) Protocol Analysis:- Supports hundreds of protocols
- 3) Filtering:- offers powerful filters to isolate specific packets or traffic types
- 4) Visualization:- Displays packet details with hierarchical layers (Ethernet, IP, TCP/UDP)

Use Cases of Wireshark

- 1) Network Troubleshooting
 - Diagnosing slow network speeds
 - Identifying bottlenecks
- 2) Security Analysis
 - Detecting malicious traffic or intrusions

3) Protocol Study:-

• Understanding packet structure and communication flow

1. Common Filters

- http - Show only HTTP traffic
- tcp port = 80 - Show traffic on TCP port 80
- ip - address - 192.168.1.1
- udp - Show only UDP traffic
